### Project Proposal (Proposed Solution) report

The proposal report aims to transform the school IT helpdesk by automating ticket classification with ServiceNow Flow Designer, boosting efficiency and accuracy. It removes the manual review of every ticket, promises better routing, less effort for IT staff and happier callers. Key features include keyword-based auto classification, dependent Category / Subcategory fields and an instant confirmation email.

| Project Overview |                                                                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Objective</b> | Automatically classify IT incidents at the time of creation, reduce manual effort for IT agents, improve ticket routing efficiency and deliver a no-code, easily maintainable solution.                                                 |
| <b>Scope</b>     | Covers the school IT helpdesk: a custom Incident Workflow table, dependent Category / Subcategory choices, a Flow Designer automation for Wi-Fi, projector, password and slow-computer issues, and an email notification to the caller. |

| Problem Statement  |                                                                                                                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | The school IT helpdesk receives many daily requests from students and teachers (Wi-Fi issues, projector failures, password problems, slow computers). IT staff manually read each request and assign the category, which is slow, error-prone and not scalable. |
| <b>Impact</b>      | Solving this gives faster ticket handling, consistent data, less workload for IT staff and quicker acknowledgement for callers.                                                                                                                                 |

| Proposed Solution   |                                                                                                                                                                                                                                                                                                                                      |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Approach</b>     | A Flow Designer flow triggers when a ticket is created with an empty Category. It checks the Short Description for keywords, updates Category and Subcategory, and sends a confirmation email to the caller.                                                                                                                         |
| <b>Key Features</b> | <ul style="list-style-type: none"> <li>- Custom table Incident Workflow with Auto Number</li> <li>- Dependent Category and Subcategory choice fields</li> <li>- Keyword-based auto classification with If / Else If logic</li> <li>- Automatic email notification to the caller</li> <li>- Update Set for easy deployment</li> </ul> |

## Resource Requirements

| Resource Type   | Description                                                           | Specification/Allocation                                                        |
|-----------------|-----------------------------------------------------------------------|---------------------------------------------------------------------------------|
| <b>Hardware</b> |                                                                       |                                                                                 |
|                 | Computing Resources<br><i>CPU/GPU specifications, number of cores</i> | Standard laptop / PC (no GPU needed)                                            |
|                 | Memory<br><i>RAM specifications</i>                                   | 8 GB                                                                            |
|                 | Storage<br><i>Disk space for data, models, and logs</i>               | Minimal - data is stored in the cloud instance                                  |
| <b>Software</b> |                                                                       |                                                                                 |
